IN THE ABSTRACT OF THE DISCLOSURE

. . . .

Amend the abstract as follows:

The present invention relates to a \underline{A} tightening band used for fixing, for example, a cover for protecting a joint of a rotary shaft of an automobile, and a method for producing the same. The tightening band realizes an improved workability of attachment, a proper tightening strength, a wider applicable range of members to be tightened, and a stable tightening strength lasting for a long time. In the tightening band, a pattern of projections and depressions is formed on the surface of each component. Preferably, the pattern is formed by providing depressions, each having a depth of 2 μ m to 30 μ m, on the surface of a band main body, a lever plate, and a lever-plate fixing member.
